

CLAIMS

1. A stationery accessory system, comprising:
a slidable tab; and
a sheetlike member including a rail;
one of the slidable tab and the rail having a channel defined along a longitudinal aspect thereof, the channel defined by a wall of the rail, and the channel having a longitudinal opening narrower than a width interior to the channel measured parallel to the longitudinal opening; and
the other of the slidable tab and the rail having an expanded edge, the expanded edge having a width greater than the longitudinal opening such that the channel and the expanded edge are slidably engageable.
2. The system of claim 1, wherein the rail is integral with the sheetlike member.
3. The system of claim 1, wherein the rail is permanently affixed to the sheetlike member.
4. The system of claim 1, wherein the rail is removably affixed to the sheetlike material.
5. The system of claim 2, wherein the sheetlike member comprises an extruded polymeric material.
6. The system of claim 5, wherein the rail is a polymeric material co-extruded with the sheetlike member.
7. The system of claim 1, wherein the sheetlike member comprises:
a wall of a file folder.

8. The system of claim 1, wherein the sheetlike member comprises:
a notebook divider.
9. The system of claim 1, wherein the sheetlike member comprises:
an organizer.
10. A method of making a stationery accessory, comprising:
extruding a length of sheet material having a rail along one edge thereof;
extruding a length of tab material;
dividing the length of tab material into individual tabs; and
dividing the length of sheet material into individual sheets; wherein
one of the tab and the rail have a channel defined along a longitudinal aspect thereof, the channel defined by a wall of the rail, and the channel having a longitudinal opening narrower than a width interior to the channel measured parallel to the longitudinal opening; and
the other of the tab and the rail having a beaded edge, the bead having a width greater than the longitudinal opening such that the channel and the expanded edge are slidably engageable.
11. The method of claim 10, wherein extruding the length of sheet material comprises co-extruding the length of sheet material and the rail.
12. The method of claim 10, further comprising:
affixing the rail to the extruded length of sheet material.
13. The method of claim 12, wherein affixing comprises:
permanently attaching the rail.
14. The method of claim 12, wherein affixing comprises:
releasably attaching the rail.
